

## PREFACE

1

2 The need to carefully evaluate and balance considerations related to treatment benefit, cost-effectiveness,  
3 and affordability has never been greater. This is validated by the recent proliferation of initiatives by a  
4 number of health care organizations to develop value frameworks with the objective of providing a more  
5 rigorous and comprehensive assessment of value when considering the adoption of new health  
6 technologies, including new pharmaceutical products.<sup>1,2</sup>

7 Since its initial release in 2000, the AMCP *Format for Formulary Submissions* has provided a framework  
8 to advise drug manufacturers regarding important payer evidence requirements as it relates to evaluating  
9 new technologies for formulary consideration. With the release of the *Format, Version 4.0*, we have  
10 attempted to incorporate updated considerations related to fostering rigorous, relevant, and ongoing  
11 scientific dialogue between manufacturers and health care decision makers (HCDM's) as it relates to  
12 assessing the safety, efficacy, and value of new health technologies. Additionally, we have addressed  
13 evolving considerations in the health care environment, including considerations related to biosimilars,  
14 medical devices, comparative effectiveness research, and specialty pharmaceuticals, to name a few.  
15 Guidance on logistical matters related to updating dossiers, the challenge of providing pre-approval  
16 dossiers, and ongoing communication between manufacturers and HCDM's is provided as well.

17 Structurally, we have provided guidance on some of these key contextual considerations in the  
18 introductory section of the *Format*, while specific guidance related to content requirements for each  
19 section of the dossier are provided in those sections, as in previous versions of the *Format*.

20

## THE ROLE OF THE AMCP FORMAT

21 The evidence requirements outlined in the *AMCP Format* are intended for use by manufacturers who are  
22 responding to an unsolicited request from HCDMs to support coverage, reimbursement, and/or formulary  
23 placement of new and existing drugs, tests, or devices or class of drugs, tests, or devices.

24 The *Format* supports the informed selection of drugs, tests, and devices by:

- 25 • Identifying the clinical and economic evidence required for the evaluation of drugs, tests, and  
26 devices
- 27 • Standardizing the synthesis and organization of the evidence in a concise document also known  
28 as the “AMCP dossier” or “product dossier
- 29 • Providing the manufacturer the ideal opportunity to communicate the value of a product that is  
30 grounded in evidence-based medicine principles
- 31 • Supporting the unsolicited request process that manufacturers must abide by in order to provide  
32 comprehensive information that goes beyond a product’s FDA-approved label
- 33 • Requiring economic models and projections of product impact on the organization and its  
34 enrolled population
- 35 • Encouraging a clear, transparent, and two-way communication process between manufacturers  
36 and HCDMs

37 The *AMCP Format* is designed to maintain a high standard of objectivity and credibility to achieve two  
38 important goals.

39 **First**, it is intended to improve the timeliness, scope, quality, and relevance of clinical and economic  
40 information provided by manufacturers to HCDMs. Further, by assessing the healthcare system impact of  
41 using a product, the evidence requested can improve the HCDM’s ability to compare the effects of  
42 formulary alternatives on clinical outcomes, value, and economic consequences for the entire healthcare  
43 system.

44 **Second**, the *AMCP Format* streamlines the evidence acquisition and review process for HCDMs and  
45 healthcare system staff. By clearly specifying the standards of evidence implicit in the existing formulary  
46 process, the *Format* furnishes pharmaceutical manufacturers with consistent direction concerning the  
47 nature and format of information that is expected. In addition, the standardized format allows healthcare  
48 system staff to formally evaluate the completeness of submissions received and to easily add the results of  
49 the healthcare system’s own systematic literature reviews and analysis. Manufacturers should understand  
50 that submission of information in the recommended format does not guarantee approval of their product  
51 for formulary listing. Manufacturers and HCDMs should view discussion about, and subsequent  
52 submission of a dossier, as a process to improve the quality and layout of information provided, but not as  
53 a formula for approval. The *Format* offers a clear, shared vision of the requirements to facilitate the  
54 collaboration necessary between HCDMs and manufacturers to support appropriate and evidence-based  
55 product evaluation. Recognizing that manufacturers may not have all the requested evidence, especially  
56 for new products, the *Format* describes the information requirements necessary to support a  
57 comprehensive assessment of the proposed product.

58 The Academy of Managed Care Pharmacy views the *AMCP Format* as a template or guide that has  
59 become the gold standard in requesting and receiving clinical and economic evidence from manufacturers  
60 for the purpose of evaluating the value of drugs, tests, and devices. While it is up to individual healthcare  
61 systems to decide how they operate their formulary review processes, AMCP urges HCDMs to request  
62 product dossiers in the *AMCP Format* from manufacturers when evaluating drugs, tests, and devices for  
63 coverage, reimbursement, and formulary decisions. The aim of the *Format* is to provide evidence  
64 requirements that meet the evidence needs of all HCDMs and healthcare systems. Though the *AMCP*  
65 *Format* Executive Committee recognizes that there are other formats, guidelines, and value frameworks

**DRAFT for Public Comment**  
**AMCP *Format for Formulary Submissions*, Version 4.0**

66 issued by other organizations, it also regards the adoption and use of *Format* as a best practice for the  
67 formulary review process.

68 The AMCP *Format* does not specify methods for assessing clinical benefit, harms, or economic impact,  
69 however the evidence presented should meet accepted standards of evidence-based medicine and health  
70 technology assessment. It is the manufacturer's responsibility to utilize appropriate study designs,  
71 analytic techniques, and data sources. Likewise, it is the requester's responsibility to critically evaluate  
72 the evidence supplied.

73

## **GENERAL TOPICS RELATED TO FORMAT V.4.0**

74 The following are general topics related to Format v.4.0. Some of these provide additional guidance  
75 related to terminology used in the Format. Other sections include guidance related to logistical  
76 considerations related to developing and maintaining dossiers, while other sections focus on content areas  
77 of relevance to the Format that were raised by internal and external stakeholders.

78

### **79 DECISION MAKERS AND MANUFACTURERS**

80 The term “healthcare decision maker” (HCDM) and healthcare system is used throughout this document  
81 to refer to ANY healthcare personnel, committee, or organization that uses an evidence-based process for  
82 making healthcare coverage and reimbursement decisions including, but not limited to payers, health  
83 plans, integrated delivery systems, pharmacy benefit management companies, specialty pharmacies,  
84 health insurance companies, medical groups, hospitals, hospital systems, Pharmacy and Therapeutics  
85 (P&T) Committees, health technology assessment (HTA) organizations, and other organized healthcare  
86 systems.

87 The term “manufacturer” is used throughout this document to refer to ANY company that develops,  
88 manufactures, or markets drugs (brand, generic, biologics, biosimilars, vaccines), tests (companion  
89 diagnostic tests), or related devices.

90

### **91 COMMUNICATIONS BETWEEN HCDMS AND MANUFACTURERS**

92 Communications between HCDMs and pharmaceutical or device manufacturers are strictly regulated by  
93 the FDA. The FDA considers proactive, solicited communications to be “promotional” and requires the  
94 content of the communications to be limited to information in the FDA approved product label. The  
95 Food, Drug, and Cosmetic Act was amended in 1997 (FDAMA Section 114) to allow proactive, solicited  
96 communications about “health care economic information” to a limited audience of “formulary  
97 committees and similar entities”.<sup>3</sup> The use of FDAMA Section 114 by manufacturers to date has been  
98 limited but recent first amendment challenges to FDA regulations on “promotion” and attempts by  
99 Congress to update the FDAMA Section 114 language could potentially allow more proactive, solicited  
100 communications in the future. In the meantime, since FDAMA Section 114 was intended to inform  
101 HCDMs of health care economic information, HCDMs should clearly articulate to manufacturers what  
102 information is needed and how it should be delivered.<sup>4</sup>

103 In addition to proactive, solicited communications, the FDA also allows manufacturers to reactively  
104 respond to unsolicited requests for information from HCDMs. It is this unsolicited request process that  
105 has historically been used for communications involving the AMCP Format – this unsolicited process  
106 continues to be the mechanism through which the AMCP Format Version 4.0 can and should be  
107 communicated to HCDMs.

108 AMCP dossiers developed according to the *Format* should be treated under the unsolicited request  
109 process by manufacturers because the Format calls for information that goes beyond the product label  
110 Therefore, at no time, shall an evidence dossier in the AMCP *Format* be sent to a HCDM or healthcare

<sup>4</sup> Peretto EM, Burke L, Oehrlein EM, et al. FDAMA Section 114: why the renewed interest? *J Manag Care Spec Pharm*. 2015;21(5):368-374. Available at: <http://www.amcp.org/WorkArea/DownloadAsset.aspx?id=19494>.

**DRAFT for Public Comment**  
**AMCP Format for Formulary Submissions, Version 4.0**

111 system without an authentic, validated unsolicited request from the requestor directly to the manufacturer.  
112 Any violation of this rule, intentional or not, jeopardizes the regulatory safe harbor for unsolicited  
113 requests that allows industry to prepare and respond to requests for product dossiers in the AMCP  
114 *Format*, as well as the Academy's original intent and mission for the *Format*.

115 In December 2011, the FDA issued a draft guidance called "Guidance for Industry: Responding to  
116 Unsolicited Requests for Off-Label Information About Prescription Drugs and Medical Devices" which  
117 outlines the FDA's current thinking on how manufacturers drugs and medical devices can respond to  
118 unsolicited requests for information about products.<sup>5</sup>

119 To qualify as an unsolicited request, the request for information must be truly *unsolicited*. Specifically,  
120 the inquiry must be initiated by the requester (formulated in his/her own mind) without prompting,  
121 suggestion or solicitation by the manufacturer or its employees.

122 Manufacturers should place a statement on the dossier that it is being provided in response to an  
123 unsolicited request.

124 Substantial on-going communication between the healthcare system and manufacturers throughout the  
125 product evaluation process is critical to manage expectations and maximize the quality of available  
126 evidence. When a dossier is requested from a healthcare system, it is important for that organization to  
127 communicate to the manufacturer basic information such as review timelines, the evaluation process, and  
128 any special needs that might exist. This allows the manufacturer an opportunity to provide timely,  
129 relevant, and specific information that meets the needs of the healthcare system. If manufacturers cannot  
130 provide specific information, it is better to understand the limitations up front. Early, ongoing dialogue  
131 between the HCDM and manufacturer is a critical success factor in optimizing the exchange of relevant,  
132 credible and timely clinical and economic evidence for decision making.

133 Healthcare systems need and want to know about new product and new indication launches for their  
134 planning purposes. Therefore, manufacturers should keep healthcare systems informed about the status of  
135 their pipeline, especially anticipated new product or new indication launches in the near future, e.g., 3 to 6  
136 months prior to FDA approval.

137 Dossiers have often been criticized by HCDMs about being 'biased'. Therefore, HCDMs should express  
138 any concerns or questions about the evidence presented in a dossier, including assumptions related to  
139 economic models, to facilitate a productive dialogue with manufacturers. Feedback from dossier users can  
140 help improve the quality of dossiers developed and provided by manufacturers.

141

## 142 **CONFIDENTIALITY**

143 The confidentiality of evidence dossiers has been an area of concern since AMCP published the first  
144 version of the *Format* in October 2000. Manufacturers have expressed concern that confidential  
145 information submitted as part of an evidence dossier, e.g., unpublished studies, off-label information,  
146 economic modeling data, will become publicly available, thus exposing sensitive data to competitors, and  
147 potentially alarming regulatory authorities worried about misleading promotion. To a large extent, the  
148 concerns should be addressed through compliance with FDA guidance on unsolicited requests and with  
149 appropriate confidentiality agreements between the healthcare system and the manufacturer. Healthcare  
150 systems should be aware that the ability of manufacturers to provide complete information is dependent  
151 on the recipient to preserve the confidentiality of that information. We note that evidence dossiers  
152 submitted to government authorities in the US, the UK, and certain other countries are made available to

---

<sup>5</sup> FDA. Draft guidance: responding to unsolicited requests for off-label information about prescription drugs and medical devices. December 2011. Available at: <http://www.fda.gov/downloads/drugs/guidancecomplianceregulatoryinformation/guidances/ucm285145.pdf>. Accessed 11/15/15.

**DRAFT for Public Comment**  
**AMCP Format for Formulary Submissions, Version 4.0**

153 the public but commercial-in-confidence information, when properly identified by the manufacturer, is  
154 redacted for the online version of the report. Special arrangements with public payers, which require  
155 public disclosure of information received, may be necessary.

156 Manufacturers may require requesting HCDMs and health systems to sign a confidentiality agreement  
157 before providing a dossier. Such agreements may also be required where prepublication data are shared.  
158 HCDMs and healthcare systems should be willing to sign such agreements and adhere to their terms.

159 Product dossiers prepared in accordance with the evidence requirements contained in the *AMCP Format*  
160 may contain off-label information and information deemed proprietary by the product manufacturer.  
161 Therefore, such dossiers may only be distributed in response to an unsolicited request.

162 Manufacturers should place a statement on the dossier that a confidentiality agreement was executed, if  
163 one was put in place.

164

## 165 **COMPARATIVE EFFECTIVENESS RESEARCH (CER)**

166 While the *AMCP Format* does not require manufacturers to use any particular research design to present  
167 evidence of benefit, harms, cost-effectiveness, or financial impact of their products, it does strongly  
168 recommend that manufacturers include evidence from comparative effectiveness research (CER) studies  
169 as they become available.

170 Initial FDA approval of products is based on randomized controlled trials (RCTs) where the product is  
171 compared to placebo or more preferably, a relevant, active comparator. Because of the highly controlled  
172 research setting, RCTs are considered the gold standard for clinical research with high internal validity  
173 and addresses the efficacy question, “Can it work?”

174 In contrast, CER conducted in a less controlled setting addresses the effectiveness question, “Does it  
175 work?” in the real world and relative to an active comparator. Real world data from CER may not be  
176 available at the time of new product launch. However, in subsequent years, real world CER should be  
177 conducted by the manufacturer as well as by other researchers, and the new evidence should be  
178 incorporated into the dossier. RCTs and CER can complement each other by generating evidence to  
179 answer questions that may be more appropriate in one study design or the other. Sometimes, it is just not  
180 feasible, for example, to conduct RCTs due to ethical or logistical factors.

181 There are many study designs that can be used to conduct CER. The *Format* does not dictate the process  
182 by which evidence is developed, nor does it provide methodological guidance. The reader is referred to  
183 other sources for more background information on various study designs such as Bayesian and adaptive  
184 trials,<sup>6,7</sup> pragmatic clinical trials,<sup>8,9</sup> prospective observational studies,<sup>10</sup> retrospective observational

185 studies,<sup>11</sup> systematic evidence reviews<sup>12,13,14</sup> including indirect treatment comparisons and network meta-  
186 analyses,<sup>15</sup> and modeling studies.<sup>16</sup>

187 The CER Collaborative ([www.cercollaborative.org](http://www.cercollaborative.org)), formed by AMCP, ISPOR (International Society for  
188 Pharmacoeconomics and Outcomes Research) and NPC (National Pharmaceutical Council), developed  
189 the CER Tool<sup>17</sup> to assist HCDMs in the evaluation and use of four types of outcomes research:  
190 prospective and retrospective observational studies,<sup>18</sup> modeling studies,<sup>19</sup> and indirect treatment  
191 comparison studies.<sup>20</sup>

192

## 193 **DOSSIER FOR DRUGS, TESTS, AND DEVICES**

194 While the original AMCP *Format* was developed to address evidence for drugs (pharmaceuticals,  
195 biologics, and vaccines), today, *the Format* aims to also provide guidance for developing dossiers for  
196 non-drug products (e.g., tests and devices) that may be relevant to healthcare systems' drug formulary and  
197 medical policy decisions.

198 Specifically, Version 4.0 has been updated to include guidelines on the evidentiary requirements for  
199 companion diagnostic tests (CDT) that was first introduced in Version 3.1 as an addendum to the *Format*  
200 (see Section 2.3).

201 Additionally, the *Format* can be used to convey evidentiary requirements for medical devices. Due to the  
202 vast number, type, and complexity of medical devices, it is recommended that medical devices that are  
203 most directly related to the use of a drug be relevant and applicable for the *Format*. Examples of medical  
204 devices where the *Format* may apply include, but not limited to: implantable drug delivery devices, blood  
205 glucose measuring devices, test strips (e.g., blood, urine), inhalation devices (e.g., nebulizers), health  
206 assessment devices and tests that elucidate health status, diagnosis, prognosis, etc. Medical device  
207 manufacturers are encouraged to develop and make available medical device dossiers for HCDMs and  
208 health systems upon unsolicited requests.

**DRAFT for Public Comment**  
**AMCP Format for Formulary Submissions, Version 4.0**

209 As such, language in the *Format* has been revised to refer to a “product” throughout which may be a drug,  
210 a test, or a device. Where a specified requirement does not apply, the manufacturer may indicate “not  
211 applicable”. AMCP recognizes the challenge of adapting the *Format* to medical devices without  
212 providing explicit requirements and encourages manufacturers to use sound judgment in providing  
213 objective information and relevant evidence about a product that will meet the needs of HCDMs and  
214 healthcare systems.

215

## 216 **COMPANION DIAGNOSTIC TESTS (CDT)**

217 Companion diagnostic tests (CDTs) have been defined in various ways, and has been referred to as  
218 ‘pharmacogenomics’, ‘pharmacogenetics’, “targeted therapy’, ‘personalized medicine’, ‘precision  
219 medicine’, ‘biomarker testing’, etc. The FDA definition describes a CDT, or an *in vitro* companion  
220 diagnostic device (IVD companion diagnostic device) as one that provides information that is essential for  
221 the safe and effective use of a corresponding therapeutic product.<sup>21</sup>

222 More specifically, in the *Format*, a CDT is defined as a laboratory test or assay that provides predictive  
223 and differential information about patients’ response to drug therapy. This is in contrast to diagnostic or  
224 prognostic tests, which provide information about the disease process rather than response to treatment.  
225 Canestaro et al. (2015) has developed the Companion test Assessment Tool (CAT) to assist HCDMs to  
226 determine whether a full technology review is necessary and, if so, what factors are likely to be most  
227 influential in the CDT’s overall value. The full publication provides a user-friendly, step-by-step  
228 algorithm and key questions to help HCDMs make these assessments.<sup>22</sup>

229 The reader is referred to other sources for background information regarding CDTs.<sup>23,24,25</sup> In addition, a  
230 number of other CDT evidence gathering and evaluating frameworks have been developed.<sup>26,27,28,29,30</sup>

### 231 **Dossier from Drug Manufacturer vs CDT Manufacturer**

232 Implementation of dossier requests for CDTs using the *Format* may be complicated by the variety of  
233 potential relationships between a drug manufacturer and CDT manufacturer/developer. The following are  
234 possible CDT development scenarios (in no order of preference):

- 235 • CDT co-developed with drug, and FDA-approved together with drug
- 236 • CDT developed independently of drug, typically after drug approval

**DRAFT for Public Comment**  
**AMCP Format for Formulary Submissions, Version 4.0**

237       • CDT developed independently and targeted for class of medications  
238 In each of these scenarios, the drug manufacturer may or may not be the same as the CDT manufacturer.  
239 In the case where the drug manufacturer is different from the CDT manufacturer, the two companies may  
240 or may not have business agreements to work collaboratively in the development and/or marketing of the  
241 drug and CDT. This scenario may be important in understanding the ability of one company to adequately  
242 provide and communicate data and information related to another company’s product. Obtaining evidence  
243 for CDTs is further complicated if the test is a lab-developed test (LDT) developed by clinical  
244 laboratories and not FDA approved. Thus, depending on the development pathway, drug manufacturers  
245 and CDT developers may have different responsibilities and processes with regard to evidence  
246 submission to health care decision makers.

247 Given the potential complexity of regulatory processes, data sources, and manufacturer relationships, the  
248 *Format* recommends the following approaches for developing dossiers with CDT evidence:

- 249       1. The CDT is co-developed with the drug
  - 250           a. The drug manufacturer should provide CDT evidence as part of the drug dossier in the  
251                AMCP *Format* because the evidence for the safety, efficacy, and value of the drug is  
252                inherently linked to the CDT.
- 253       2. The CDT is developed independently of the drug
  - 254           a. If the CDT is required in the drug label, the drug manufacturer should provide data on the  
255                clinical validity, clinical utility, and economic value of both the drug and CDT in the  
256                drug dossier. Information on analytic validity should be provided if feasible.
  - 257           b. If the CDT is not required in the drug label, then the CDT developer should provide a  
258                “CDT dossier” that provides information as outlined in this section.
- 259       3. The CDT is developed independently and is targeted for a class of medications
  - 260           a. The CDT developer should provide a “CDT dossier” that provides information as  
261                outlined in this section.

## 263 **BIOSIMILARS**

264 As FDA-approved biosimilars reach the market, formulary decision makers may require a body of  
265 efficacy, safety, economic, and comparative effectiveness data similar to that of the innovator product in  
266 order to make rational, evidence-based decisions regarding coverage and reimbursement. In response to  
267 unsolicited requests, manufacturers of biosimilars should develop and provide product dossiers like those  
268 of the innovator products.

269 The extent and scope of animal and human studies needed for biosimilar product development programs  
270 may differ markedly from those of generic versions of non-biologic products. In addition, FDA has stated  
271 that the type and amount of analyses and testing that will be sufficient to demonstrate biosimilarity and/or  
272 interchangeability will be determined on a product-specific basis. Biosimilars do not fit the definition of a  
273 generic equivalent product, i.e., identical or bioequivalent, to a brand name drug in dosage form, safety,  
274 strength, route of administration, quality, performance characteristics and intended use. Biosimilars are  
275 not generic biologics. As such, manufacturers of biosimilars should incorporate these considerations into  
276 the dossier to allow HCDMs to fully evaluate these products.

277 For more information, FDA has released several guidance documents:

- 278       • According to the FDA, for a product to be a biosimilar or interchangeable, the manufacturer must  
279        submit a 351(k) biologics license application (BLA) that demonstrates biosimilarity<sup>31</sup>

296 **HETEROGENEITY OF TREATMENT EFFECT**

297 Heterogeneity of treatment effect is defined as “nonrandom explainable variability in the direction and  
298 magnitude of individual treatment effects, including both beneficial and adverse effects.”<sup>40</sup> Response,  
299 whether beneficial or adverse, to a treatment varies from individual to individual. It is important for  
300 HCDMs to understand heterogeneity of treatment effect when evaluating therapies for clinical, coverage  
301 and reimbursement decisions for patients. While evaluating the body of evidence for a treatment, HCDMs  
302 need to consider individual patient variability, variability within populations studied, and variability  
303 between clinical studies. Malone et al. has developed tools for HCDMs to assess whether clinically  
304 relevant differences exist between individuals, populations, or clinical trials.<sup>41</sup>

306 **UPDATING DOSSIERS**

307 A common question from manufacturers is, “When should a dossier be updated?” Dossiers should be  
308 reviewed and updated when there are significant changes, e.g., changes to the prescribing information,  
309 line extensions, new safety information, or any information that materially impacts the overall evidence.  
310 While most healthcare systems request dossiers for products when they are newly approved by the FDA,  
311 dossiers should be used beyond initial launches for subsequent product or class reviews. Ideally, dossier  
312 updates should be evidence-based, i.e., updates are triggered by availability of new evidence, for  
313 example:

- 314 1. The manufacturer files a supplemental application to the FDA for a new indication; the regulatory  
315 decisions should be included in the dossier whether the new indication is approved or denied
- 316 2. The FDA issues advisory statements about the use of a product, e.g. established a new boxed  
317 warning, etc.
- 318 3. Significant new clinical or economic evidence becomes available that may (not exhaustive list):  
319 a. Further support the use of the product for the approved indication  
320 b. Identify patients or sub-populations who should or should not receive the product  
321 c. Demonstrate real world effectiveness and long-term effectiveness  
322 d. Elucidate long-term safety

323 When updating a dossier, the manufacturer may conduct a complete revision to incorporate new evidence,  
324 delete obsolete information, and revise content and format, resulting in a new version of the dossier, or  
325 amend existing dossier with a supplemental document that acknowledges new evidence with proper  
326 citations, identifies obsolete information in the existing dossier, and describes any addition modifications  
327 relevant to the HCDM. The manufacturer should provide HCDMs with a way to identify newly added  
328 information, e.g., highlighting revised/new sections or content, describe changes in an appendix, include a  
329 summary of changes in a cover letter, etc.

330 When a manufacturer reviews a dossier for potential revision, and determines that a revision is not  
331 necessary, this should be indicated on the title page of the dossier. In the absence of new evidence,  
332 evaluate for technical accuracy on an annual basis, e.g., price increase, new model assumptions, etc. All  
333 dossiers should have the original date of issue as well as the dates of any revisions or reviews for potential  
334 revisions.

335 When a HCDM requests a dossier that is under revision, the manufacturer should supply the current  
336 version of the dossier, inform the requestor of the status of the dossier and the expected timeframe for  
337 completion of the revision, and offer to send the revised version when completed. Alternatively, the  
338 manufacturer may only provide the updated version when completed.

339 Another common question from manufacturers is, “Can an updated dossier be provided to HCDMs who  
340 had previously requested and received a dossier?” In general, manufacturers should not freely and  
341 automatically send updated dossiers to previous requestors without an unsolicited request; in other words,  
342 another unsolicited request from the HCDM is required in order to send an updated dossier. However, as  
343 a result of AMCP’s previous discussions with FDA regulatory staff, a HCDM may, at the time of original  
344 dossier request, include a statement that he/she would like to receive updated dossiers, if any, subsequent  
345 to the first dossier received. The request for updated dossiers must be for the same product as the original  
346 request, and the request must specify a specific length of time, e.g., for 6 months. The request for updated  
347 dossiers should not be indefinite. Adherence to this process will avoid HCDMs from having to submit  
348 numerous requests for updated information, especially since they may not be aware when updated  
349 dossiers may be available. Additionally, the explicitness of the unsolicited request for an updated dossier  
350 within a specific time frame will help manufacturers maintain compliance to the unsolicited request  
351 process.

352 The manufacturer may determine that a dossier will no longer be kept current, e.g., the product is near the  
353 end of its branded lifespan. If the manufacturer continues to provide the dossier to requesters, then this  
354 status should be indicated on the dossier. If the manufacturer discontinues the availability of the dossier,  
355 then a rationale for its discontinuation should be provided to requesters of that dossier.

356 Development and organization of the dossier for a product with multiple FDA approved indications  
357 should be handled at the discretion of the manufacturer. For example, manufacturer may develop separate  
358 sections for each indication within the same dossier, or may develop separate dossiers for each indication  
359 or group of indications.

360

## 361 **PRE-APPROVAL DOSSIERS**

362 It is not uncommon for healthcare systems to want a dossier well before FDA approval. In fact, this is  
363 one of the most common comment received from HCDMs about dossiers.

364 For regulatory and compliance reasons, manufacturers are limited in what they can proactively  
365 communicate before FDA approval. Furthermore, it is not possible for manufacturers to provide a full  
366 dossier that meets all the requirements of the *Format* prior to product approval by the FDA. For example,  
367 it is not possible for manufacturers to provide the cost or price of the product before final FDA approval.

368 However, manufacturers are able to provide certain information, generally public or published data,  
369 regarding product before FDA approval upon an unsolicited request to the company's medical  
370 information or medical communications department. The information provided depends on 1) the  
371 HCDM's specific unsolicited request, and 2) the information that the manufacturer deems appropriate and  
372 available to provide.

373 Thus, manufacturers may use the current *Format* as a template to provide information where feasible in  
374 response to a HCDM's request for a "dossier" before a product's FDA approval. In general, this  
375 information is in the public domain in some fashion, and may rarely include data on file. This "pre-  
376 approval" or "pre-launch dossier" may include, but is not limited to:

- 377 1. Clinical trial information from Phase 1, Phase 2, and Phase 3 studies
  - 378 ○ Peer-reviewed publications
  - 379 ○ Medical congress abstracts, posters, presentations
  - 380 ○ Medical information or medical communication departments' response letters
- 381 2. Information from clinicaltrials.gov
- 382 3. Pre-clinical studies
- 383 4. Data on file per manufacturer's discretion
- 384 5. Disease state information, e.g., disease description, epidemiology, clinical presentation, currently  
385 available therapies, clinical practice guidelines, etc.
- 386 6. Pipeline product information, e.g., proposed mechanism of action
- 387 7. Any other information that a manufacturer deems relevant to the request and allowable according  
388 to the manufacturer's policies and procedures
- 389 8. Some manufacturers may consider providing certain information under a confidentiality  
390 agreement

391

## 392 **MEDIA FOR DOSSIER AND MODEL SUBMISSIONS**

393 Manufacturers should submit dossiers in an electronic format rather than in print. This will help reduce  
394 resource expenditures and improve healthcare system staff's ability to transfer evidence directly into P&T  
395 committee submission monographs. **In addition manufacturers must provide a transparent,**

**DRAFT for Public Comment**  
**AMCP Format for Formulary Submissions, Version 4.0**

396 **unlocked copy of the model without a graphical interface.** It should be presented electronically as an  
397 Excel workbook, ASCII tab-delimited file or an alternative electronic format that is agreed upon by the  
398 requesting organization or its consultants and the manufacturer.

399

400 **IMPLEMENTATION OF VERSION 4.0**

401 A new dossier under development or an existing dossier being updated at the time of Version 4.0 release  
402 may be converted to the new *Format* with relative ease. If creation or revision of the dossier is close to  
403 completion at the time of Version 4.0 release (e.g., approximately than half complete), then adherence to  
404 Version 3.1 is an option.

405 For a subsequent revision of an existing dossier that commences after the release of Version 4.0,  
406 conversion to Version 4.0 is highly recommended.

407 Development of a new dossier that commences *after* the release of Version 4.0 (after April 2016) should  
408 comply with Version 4.0 of the *Format*.

409  
410

## **EVIDENCE REQUIREMENTS FOR FORMULARY SUBMISSION**

### **1.0 EXECUTIVE SUMMARY – CLINICAL AND ECONOMIC VALUE OF THE PRODUCT**

413 This section of the submission represents the principal opportunity for a manufacturer to briefly  
414 summarize the value of its product. The Executive Summary should highlight the key evidence on clinical  
415 and economic value from Sections 2 through 5, and it should be representative of the body of evidence  
416 found in Sections 2 through 5. The manufacturer should briefly describe the clinical and economic  
417 information presented in the dossier using the layout prescribed in Sections 1.1 and 1.2 and state the  
418 expected per unit product cost. Based on this information, the manufacturer should articulate a value  
419 argument to justify these expected expenditures for this product in the context of its anticipated effects on  
420 the clinical evidence, health outcomes, and the economic consequences for the healthcare system.  
421 Throughout the Executive Summary, the reader should be referred to those places in the full dossier that  
422 justify claims and other statements made in the Executive Summary. Hyperlinks to these areas are  
423 especially helpful.

#### **1.1 CLINICAL BENEFITS**

424 Begin with the FDA-approved indication for the product and a short synopsis of the efficacy and  
425 safety information (from the prescribing information and clinical trials). Summarize the clinical  
426 benefits of the proposed product, in terms of:

- 428 • Efficacy and Effectiveness
- 429 • Comparative effectiveness relative to available alternative therapies
- 430 • Safety/tolerability
- 431 • Shortcomings of current treatment and the unmet medical need that the PROPOSED
- 432 THERAPY addresses

#### **1.2 ECONOMIC BENEFITS**

433 Summarize the economic benefits of the proposed product, in terms of:

- 435 • Cost per unit
- 436 • Context of the proposed cost: potential clinical benefits provided (including quality of
- 437 life benefits) and potential economic benefits (including savings or cost offsets)
- 438 • Shortcomings of other therapies

439 Briefly present results of any observational research or economic data, with inclusion of the per  
440 member per month (PMPM) or incremental cost effectiveness ratio (ICER) result at minimum.  
441 Briefly summarize other published information on the cost or economic impact of the product  
442 (such as impact of resource utilization or other cost offsets).

443 Include the economic impact of special handling, delivery, route and site of administration,  
444 REMS programs, and other administrative offsets that would be above and beyond the cost of the  
445 product.

#### **1.3 CONCLUSIONS**

446 Summarize the value of the proposed product. Highlight key points regarding the clinical and  
447 economic advantages and uniqueness of the product are highlighted. Finally, based on the  
448 information presented in Sections 2 to 5 that follow, the conclusions should include a statement  
449

450 regarding the expected impact of the product, relative to other available treatment options both  
451 pharmaceutical and non-pharmaceutical.

## 452 **2.0 PRODUCT INFORMATION AND DISEASE DESCRIPTION**

### 453 **2.1 PRODUCT DESCRIPTION**

454 Manufacturers are required to provide detailed information about their product. They should  
455 compare the new product with other products commonly used to treat the condition, whether or  
456 not these products are currently on the healthcare system's formulary.

457 The product description consists of information that traditionally has been found in the FDA-  
458 approved label or prescribing information/package insert (PI) as described below. It also contains  
459 information that goes beyond the scope of the PI..

460 Basic product information should be provided, including a brief discussion of what the product is,  
461 and any significant attributes that define the product's place in therapy (e.g. kinetics, adverse  
462 event profile, etc.). Verbatim language from the PI do not need to be supplied here. If there is not  
463 substantive data and information that can be provided beyond the PI, these sections should be left  
464 blank and the reader referred to the copy of the PI in the Appendix. In those cases where one or  
465 more of these attributes (pharmacology, pharmacokinetics, pharmacodynamics, contraindications,  
466 warnings, precautions, adverse events, interactions, and/or dosing) is of major significance in  
467 defining the value of a product, additional information beyond PI should be provided.

468 The following are the components that should be supplied:

- 469 1. Generic, brand name and therapeutic class of the product
- 470 2. All dosage forms, including strengths and package sizes
- 471 3. The National Drug Code (NDC) for all formulations. For specialty pharmaceuticals that  
472 may be covered under the medical or pharmacy benefit, additional codes are required in  
473 this section. Provide Healthcare Common Procedure Coding System (HCPCS) codes  
474 applicable to these products, as well as any Current Procedural Terminology (CPT) codes  
475 that are relevant to reimbursement. International Classification of Diseases (ICD)-10  
476 codes are also advisable to include for any indications specified in the PI.
- 477 4. The ASP and WAC cost per unit size (the payers contract price, if available, should be  
478 included as well)
- 479 5. AHFS or other Drug Classification
- 480 6. FDA approved indication(s) and the date approval was granted (or is expected to be  
481 granted). Also other significant off-label uses and potential new indications being  
482 studied.
- 483 7. Pharmacology\*
- 484 8. Pharmacokinetics/Pharmacodynamics\*
- 485 9. Contraindications\*Warnings/Precautions/Adverse Effects\*
- 486 10. Interactions\* with suggestions on how to avoid them
  - 487 • Drug/Drug
  - 488 • Drug/Food
  - 489 • Drug/Disease
- 490 11. Dosing and Administration\*
  - 491 • For specialty pharmaceuticals, include any instructions for preparation,  
492 administration, and a description of any unique type of delivery devices that do not  
493 appear in the package insert, as well as information on setting of care. Verbatim  
494 language from the package insert should not be supplied here

- 495 12. Access, e.g. restrictions on distribution, supply limitations, anticipated shortages, and/or  
496 prescribing restrictions
- 497 • For a specialty pharmaceutical, this section should be expanded up to cover the  
498 following information: considerations for the product around its distribution  
499 channels; prescribing restrictions for the product if applicable; handling instructions;  
500 ordering instructions for the product; access assistance information
- 501 13. Co-Prescribed / Concomitant Therapies, including dosages, recommended use of other  
502 agents or treatments with the product, and the rationale and clinical benefit associated  
503 with the co-prescribed/concomitant therapies.
- 504 14. Concise comparison of PI information with the primary comparator products in the same  
505 therapeutic area focused on safety and efficacy and include: dosing, indications,  
506 pharmacokinetic/pharmacologic profile, adverse effects, warnings, contraindications,  
507 interactions and other relevant characteristics (expand as appropriate for the therapeutic  
508 class). The material may include a discussion of comparator product(s) or services that  
509 the proposed product is expected to substitute for, or replace. This information should be  
510 presented in tabular form. If direct head-to-head trials have been conducted on the  
511 product and its comparators, this should be noted here, and the reader referred to the  
512 review of those trials in Section 3 of the dossier. Include outcomes whether in product  
513 label or not, i.e., include relevant on- and off-label information.
- 514 15. For biosimilar products, comparator information about the innovator product should be  
515 included as well as evidence that demonstrate biosimilarity or interchangeability
- 516 16. Describe how product may impact quality measures, e.g., HEDIS scores. Include studies  
517 that support this information in Section 3 or 5.

518 \*Verbatim language from the Approved Package Insert should not be supplied here. If there is  
519 not substantive data or information that can be provided beyond the label, these sections should  
520 be left blank and the reader referred to the copy of the PI which is in the Appendix.

## 521 **2.2 PLACE OF THE PRODUCT IN THERAPY**

522 Information presented in this section should be brief. Ideally, information should be provided in a  
523 table or bulleted list. For products with multiple indications, the following information should be  
524 provided for each indication. Do not duplicate information presented in Sections 3.0, 4.0, and 5.0.

### 525 **2.2.1 DISEASE DESCRIPTION**

526 The intent is to give the reader a good overall sense of the disease. The disease  
527 description should be brief, and should include the disease and characteristics of the  
528 patients who are treated for the condition. Manufacturers should provide a description of  
529 specific patient subpopulations in which the product is expected to be most effective, if  
530 known. Include clinical markers, diagnostic or genetic criteria, or other markers, if  
531 known, that can be used to identify these subpopulations. Present a brief summary of  
532 information from the literature for each topic. Ideally, information should be provided in  
533 a table or bulleted list.

534 Disease specific descriptive information should include, but not be limited to:

- 535 a) Epidemiology and relevant risk factors, with a focus on identifiable  
536 subpopulations that would be appropriate for the use of the product
- 537 b) Pathophysiology
- 538 c) Clinical presentation
- 539 d) Societal, humanistic and/or economic burden

540 Specialty pharmaceuticals often treat rare diseases that may be unfamiliar, with relatively  
541 little information available in the public domain. This section may be expanded to  
542 provide greater detail for rare conditions treated with specialty pharmacy.

543 **2.2.2 APPROACHES TO TREATMENT**

544 The key questions to address are: How is the disease/condition currently treated? How  
545 does the new product fit into standard or existing therapy?

546 Provide a VERY brief summary of information from the literature for each topic; do not  
547 duplicate information included in other sections:

- 548 a. Summarize current approaches to treatment including principal therapeutic  
549 options (drug and non-drug), common practice patterns, or standards of care;  
550 include recommendations supported by well-accepted or nationally recognized  
551 clinical practice guidelines and consensus statements.
- 552 b. Describe the place and anticipated uses of the proposed product for treating  
553 disease, especially for certain subpopulations that can be targeted for the use of  
554 the product, including comparative effectiveness of product relative to alternative  
555 therapies
- 556 c. Indicate the appropriate care setting(s) for the product such as self-administration  
557 by the patient, by a health care professional in the home, in an infusion therapy  
558 clinic, in a physician office, or in a hospital.
- 559 d. Describe heterogeneity of treatment effect, if any, related to the use of the  
560 product. Response to therapy may vary from patient to patient. Any information  
561 that substantiates heterogeneity effects (benefit and harms) of the proposed  
562 therapy should be described and supported with evidence.
- 563 e. Include proposed ancillary disease or care management intervention strategies to  
564 be provided by the manufacturer that are intended to accompany the product at  
565 launch. Services intended to accompany a specialty pharmaceutical at launch  
566 should be described. These may include any of the following: patient education  
567 services, nursing administration support services, programs intended to promote  
568 adherence, coordination of information among providers or facilities, sharps  
569 disposal, and financial assistance to patients. Specific claims made regarding the  
570 benefits of these services should be documented in this section and supported by  
571 scientific evidence described in this section or reported in Section 3.0 or 5.0 if  
572 applicable. It should be clearly stated when there is no scientific evidence to  
573 support claims of benefits for these services. For patient assistance programs, it is  
574 optimal to include the terms of the program and the expected number of  
575 beneficiaries.
- 576 f. Disclose other product development or post-marketing obligations as required by  
577 the FDA such as a Risk Evaluation and Mitigation Strategy (REMS), Phase IV  
578 trial, patient registry, restricted distribution channel, and other elements designed  
579 to assure the safe use of the product. In addition to the existing instructions for  
580 this section, if a multi-faceted program intended to accompany the product at  
581 launch will include REMS alongside other elements, describe it in section 2.2.2.e  
582 and note in 2.2.2.f that the program contains a REMS component.
- 583 g. Describe the expected outcome(s) of therapy, e.g. a cure, palliation, relief of  
584 symptoms, quality of life, patient reported outcomes, productivity, etc. Describe  
585 any clinical markers that that are linked to disease outcome, e.g. LDL lowering.
- 586 h. Other key assumptions and their rationale.

587 **2.2.3 RELEVANT TREATMENT GUIDELINES AND CONSENSUS**  
588 **STATEMENTS FROM NATIONAL AND/OR INTERNATIONAL BODIES**

589 This section should describe the treatment guideline’s position on the therapy. Include  
590 position statements and validated tools from national organizations and international  
591 HTA bodies, e.g., NICE. Next, an attempt should be made to generalize these findings to  
592 the populations of the requesting organization. Discuss the implications of any  
593 differences that exist between the literature and typical practice patterns and patient  
594 populations. When more than one disease is addressed, complete the description for each  
595 separate condition. The requesting organization and the manufacturer should determine  
596 the relevant treatment options for comparison during the initial pre-submission meeting.

597 **2.3 EVIDENCE FOR COMPANION DIAGNOSTIC TESTS**

598 **2.3.1 PRODUCT INFORMATION**

599 When a CDT has been co-developed with a drug, or when the CDT is required per FDA  
600 labeling, then the three elements, clinical validity, clinical utility, and economic value,  
601 will generally be captured in the drug dossier according to the *Format*. However, in  
602 cases where the CDT is not inherently tied to the drug evidence, then the CDT developer  
603 should respond to an unsolicited request with a separate CDT dossier.

- 604 a. Generic name, brand name, manufacturer or clinical laboratory  
605 b. Type of test: technical, e.g., immunohistochemical (IHC), fluorescent in situ  
606 hybridization (FISH), gene expression profile, etc.  
607 c. Target: describe test target, e.g., biomarker, microarray patter, etc.  
608 d. FDA cleared or approved indication(s)/use(s) with companion drug  
609 e. Date of FDA clearance or approval  
610 f. Intended use: clinical basis for CDT, e.g., diagnosis, prognosis and management,  
611 risk management, treatment, monitoring or pre-symptomatic testing  
612 g. Indication and target population(s); prevalence of disease/condition and CDT  
613 variant in target population  
614 h. Place of CDT in drug therapy  
615 i. Contraindications, warnings/precautions, interactions relative to CDT use  
616 j. Alternative tests and options available, whether they are CDTs or LDTs; describe  
617 relative advantages and disadvantages  
618 k. Other key assumptions and their rationale  
619 l. Supporting clinical and economic evidence for the test, using ACCE framework:  
620 1. Analytical Validity: How well does the test identify the target or marker  
621 it is intended to identify?  
622 • Is the accuracy with which a particular genetic *or* phenotypic  
623 characteristic identified within professional standards and federal  
624 regulation requirements?  
625 • Sensitivity: how often is the test positive when the marker is present?  
626 • Specificity: how often is the test negative when the marker is not  
627 present?  
628 • Accuracy: how often is the test correct?  
629 • Precision: reproducibility of the test  
630 2. Clinical Validity: How well does the test identify the disease or medical  
631 condition of interest?  
632 • Positive predictive value (PPV): how often does a patient that tests  
633 positive have the medical condition?

- 634
- 635
- 636
- 637
- 638
- 639
- 640
- 641
- 642
- 643
- 644
- 645
- 646
- 647
- 648
- 649
- 650
- 651
- 652
- 653
- 654
- 655
- 656
- 657
- 658
- 659
- 660
- 661
- 662
- Negative predictive value (NPV): how often does a patient that tests negative not have the medical condition?
  - Threshold(s) used to separate a positive from a negative result
  - In which populations has the test been validated, and in how many studies?
3. Clinical Utility: How does the test improve patient outcomes?
- Interventions that are based on positive and negative test results
  - Efficacy/effectiveness and safety of the clinical intervention implemented as a result of the test
  - Changes in patient outcomes, treatments received, clinical events, impact on disease progressions, risk-benefit assessment, morbidity, quality of life, survival, etc.
  - Consider inclusion of quantitative risk-benefit decision analytic modeling
4. Economic Value
- What is the expected difference in costs and outcomes with test compared to usual care, including cost offsets from changes in drug utilization, side effect treatment, and other healthcare services, and health outcomes?
  - The economic analysis should include, among other aspects, the prevalence of the condition, prevalence of the CDT marker of interest, and burden on the patient or health care system to collect and process the biological sample.
  - Include incremental cost per diagnosis, treatment modification, events avoided, life years saved, and quality-adjusted life-years gained, etc.
- m. Packaging description, regulatory codes, classification(s), and identifiers
- n. Billing and reimbursement codes, price
- o. Copy of the product label or package insert

### **2.3.2 PLACE OF CDT IN CLINICAL PRACTICE**

CDT manufacturers or providers who develop a stand-alone CDT dossier should include the following information:

- 666
- 667
- 668
- 669
- 670
- 671
- 672
- 673
- 674
- 675
- 676
- 677
- 678
- a. Disease description
    - a. Epidemiology and relevant risk factors
    - b. Pathophysiology
    - c. Clinical presentation
    - d. Societal and/or economic impact of disease
  - b. Approaches to treatment
    - a. Diagnosis (principal options, practice patterns, alternative options)
    - b. Anticipated use of test in patient management
    - c. Prognosis (expected intermediate health outcomes, expected net health outcomes of treatment, etc.)
    - d. Relevant clinical practice guidelines, clinical pathways, health technology assessments, systematic reviews
    - e. Other key assumptions and their rationale

679 **2.3.3 SUPPORTING CLINICAL DATA**

680 Where there are studies pertaining to the CDT that do not belong in Section 3.0,  
681 summarize those studies in this section.

682 For CDT manufacturers or providers who develop a stand-alone CDT dossier, all clinical  
683 trials that include the CDT should be summarized in this section.

684 Submit summaries of key studies that have been conducted, whether published or not, for  
685 example:

- 686 • Analytical validation studies
- 687 • Clinical validation studies
- 688 • Clinical utility studies (randomized trials, prospective effectiveness trials, case  
689 series, retrospective studies, systematic reviews, meta-analyses)
- 690 • Outcomes studies (decision-analytic modeling studies; prospective, trial-based  
691 cost-effectiveness studies; cross-sectional or retrospective costing studies and  
692 treatment pattern studies; systematic review articles; patient reported outcomes  
693 (PRO) studies, quality of life studies)
- 694 • Safety studies

695 Evidence in summaries should include:

- 696 a. Setting and location of study
- 697 b. Study design, Research question(s)
- 698 c. Inclusion and exclusion criteria
- 699 d. Patient characteristics (demographics, number studied, disease severity,  
700 comorbidities)
- 701 e. Intervention and control group
- 702 f. Patient follow-up procedures (e.g., if an intention-to-treat design is used, were  
703 drop-outs followed and for what time period?); Treatment/follow up period
- 704 g. Clinical outcome(s) measures
- 705 h. Outcomes evaluated
- 706 i. Delineate primary vs. secondary study endpoints and their corresponding results
- 707 j. Other results/outcomes reported (e.g., quality of life, assay performance)
- 708 k. Principal findings
- 709 l. Statistical significance of outcomes and power calculations
- 710 m. Validation of outcomes instrument (if applicable)
- 711 n. Compliance behavior
- 712 o. Generalizability of the population treated
- 713 p. Relevance to enrolled populations
- 714 q. Publication citation(s)/references used
- 715 r. State whether trials or other studies for the product are registered in a public trials  
716 registry, and if so, provide access information (e.g. [www.clinicaltrials.gov](http://www.clinicaltrials.gov))

717 **3.0 PRIMARY CLINICAL EVIDENCE**

718 Section 3.0 should consist of all primary clinical studies that support the use and value of the product  
719 reported in a clear and concise format. Specifically, primary clinical studies that investigate any aspect of  
720 the product directly in patients, i.e., research conducted in patients, regardless of study design should be  
721 included. This includes interventional studies, studies that require obtaining patient consent, or studies  
722 that measure clinical endpoints, patient outcomes, or collect information directly from patients. Study  
723 results and outcomes include efficacy, effectiveness, comparative efficacy, comparative effectiveness,  
724 safety, long-term safety, patient preference, patient adherence, patient reported outcomes, quality of life,  
725 evidence that identify patient subgroups or clinical setting that may be more appropriate, and other  
726 clinically-related outcomes.

727 Comparative evidence is a necessary component of a comprehensive product dossier, regardless of the  
728 methodology used to generate the evidence. For this reason, it is strongly recommended that studies  
729 involving comparative effectiveness research be incorporated into the product dossier. The payer is  
730 particularly interested in head-to-head clinical studies between the proposed product and the principal  
731 comparators. Summaries of trials for key comparator products are desirable but not required.

732 In addition, primary clinical evidence that are relevant for this section include the following criteria:

- 733 1. FDA-approved indications and unapproved uses
  - 734 • Potential off-label uses are of significant interest to HCDMs. As such, clinical studies
  - 735 involving off-label uses must be included in dossiers. Manufacturers should clearly
  - 736 delineate evidence for on- and off-label uses, e.g., organize and report on-label
  - 737 indication(s) and information first and off-label thereafter.
- 738 2. Published and unpublished studies and data
  - 739 • Studies available from published journals; medical congress abstracts, posters, and
  - 740 presentations; manuscripts submitted or accepted by medical journals, clinicaltrials.gov,
  - 741 press releases, manufacturers' data on file
- 742 3. Any study design
  - 743 • While specific study designs are not prescribed in this section, manufacturers should
  - 744 include studies that generate evidence from studying patients directly which may include,
  - 745 for example, randomized controlled trials (Phase 2, 3, 4), open-label studies, pragmatic
  - 746 trials, observational or cohort studies, registries, case series, case reports, and surveys
  - 747 • Studies may have one or more study arms
- 748 4. Study results regardless of positive, negative, or null findings
- 749 5. U.S. and ex-U.S. studies
- 750 6. Relevant data and findings from the FDA and other governmental agencies
- 751 7. Ongoing clinical trials and links to their registry information
- 752 8. *In vitro*, animal, and Phase 1 studies are generally not included unless the value proposition is
- 753 based on relevant pharmacologic, pharmacodynamics, or pharmacokinetic evidence in these
- 754 earlier studies

755 It is important that the dossier is transparent and reflects the full body of evidence that exists for a  
756 product. For a new product, available evidence may be limited to a few studies and inclusion of all studies  
757 in the dossier is easy. For a product that has been available for several years, there may be a very large  
758 number of studies in the medical literature and inclusion of *every* study may be impractical for both  
759 manufacturer and HCDMs. In such cases, it is important that the manufacturer exhibit transparency and  
760 fair representation concerning the evidence included in the dossier, while at the same time providing a  
761 dossier that is useful and manageable for HCDMs. Therefore, it's suggested that in such cases, the  
762 evidence be separated into three different categories:

**DRAFT for Public Comment**  
**AMCP Format for Formulary Submissions, Version 4.0**

- 763 1. Large key studies that are critical or add significantly to the knowledge base of the product should  
764 be included as study summaries and evidence tables
- 765 2. Smaller but informative studies that may add to the evidence base, but are not quite as rigorous as  
766 those listed above should be included as evidence tables only
- 767 3. All other studies that have been reported, but do not add significantly to the knowledge base of  
768 the product should be identified in a bibliography only

769 The manufacturer may also define a specific set of objective criteria for inclusion and exclusion of  
770 studies, and describe how studies were selected for inclusion and exclusion in this section. Studies  
771 excluded do not need to be identified in a bibliography, however the manufacturer should disclose that  
772 certain studies have been excluded and describe the reasons for the exclusion via literature search strategy  
773 and/or consort diagram. Considerations for establishing inclusion or exclusion criteria may be, but not  
774 limited to: study phase (Phase 3 vs Phase 2 vs Phase 1), study design (e.g., controlled trial vs case series),  
775 number of subjects (e.g., studies with greater than X number of subjects), etc.

776 The manufacturer must clearly explain the objective rationale for delineation and assignment of studies  
777 into each of the categories above to avoid “cherry-picking” and bias. Since these definitions may vary  
778 depending on the context of the product, clinical setting, available treatment alternatives (e.g., common  
779 disorder vs orphan disease), the manufacturer must justify how studies are included study summaries vs  
780 evidence tables vs bibliography.

781 If the results of a trial have been reported in more than one journal article or conference abstract, poster,  
782 or oral presentation, all may be combined into one summary and one evidence table row, citing all the  
783 sources from which data have been drawn and clearly stating the total number of subjects. Discuss  
784 important study findings and comment on their implications for different patient populations. Systematic  
785 reviews or meta-analyses are to be included in Section 5.0

786 For products with more than one approved indication, the pharmaceutical manufacturer should decide  
787 how reports for on-label studies should be presented. If the manufacturer should decide to have separate  
788 dossiers for each approved indication, those requesting dossiers must be apprised of the existence of more  
789 than one dossier, and that each can only be supplied pursuant to an unsolicited request. In all cases  
790 however, all studies for a given indication should be grouped together in the dossier.

791 The length and level of detail for study summaries and evidence tables may vary based on the amount of  
792 data that is available. It must be noted that HCDMs want concise, focused, and user-friendly presentation  
793 of data. The *Format* no longer dictates the number of pages or length for study summaries, however it is  
794 strongly recommended that manufacturers use good judgment in managing the length of dossiers. One of  
795 the most common complaint from HCDMs is that dossiers are too long.

796 The manufacturer should grade all studies listed in the dossier, based on a recognized method to evaluate  
797 quality of studies and should identify which method is being used. Where possible, provide a link to  
798 original sources if they are free.

799 The manufacturer should provide journal reprints, copies of congress abstracts, posters, and presentations,  
800 and other available study information upon request by HCDMs.

801 For drugs designated by the FDA as “breakthrough drugs” the evidentiary requirements are the same as  
802 for other drugs. For drugs determined to be “biosimilars,” basic evidentiary requirements are the same as  
803 for “traditional” and “specialty” pharmaceuticals. While it is recognized that trials dealing with  
804 interchangeability, dosing equivalency, comparison with innovator agents, etc. are especially important,  
805 all trials dealing with biosimilars should be reported since there is often limited data available for such  
806 products, and formulary decision-makers need access to all relevant evidence and data.

807 **3.1 STUDY SUMMARIES**

808 Study summaries should include the following items where available and applicable:

- 809 1. Publication citation(s), study name, Clinicaltrials.gov ID number, sponsor or funding  
810 source  
811 2. Objective, location, and study start and completion dates  
812 3. Trial design, randomization, and blinding procedures  
813 4. Setting, inclusion, and exclusion criteria  
814 5. Baseline patient characteristics and demographics  
815 6. Drop-out rates and procedures for handling drop-outs (ITT, per protocol, etc.)  
816 7. Treatments and interventions, dosage regimens, washout period, concomitant therapies,  
817 etc.  
818 8. Clinical outcome(s) evaluated, measured, and collected, delineating primary vs secondary  
819 endpoints as well as pre-specified vs post hoc  
820 9. Statistical significance of outcomes and power calculations  
821 10. Validation of outcomes instruments (if applicable)  
822 11. Generalizability of the population treated  
823 12. Study limitations, as stated by the authors  
824

### 825 **3.2 EVIDENCE TABLES**

826 Evidence tables should include the following data elements:

- 827 1. Citation, (if unpublished, give abstract information or indicate “data on file”)  
828 2. Treatments  
829 3. Sample size and length of follow-up  
830 4. Inclusion/exclusion criteria  
831 5. Design  
832 6. Primary Endpoints  
833 7. Secondary Endpoints  
834 8. Results: Provide an explicit statement of effect size, not just relative risk reduction and/or  
835 statistical significance. Within the Results column, include a table of key results.  
836 9. Statistical significance

837 In general, an evidence table for an individual study should fit on one page. It may be helpful to  
838 display evidence tables in landscape rather than portrait formats with appropriate use of  
839 abbreviations and other acceptable ways to display data in a clear, objective, and concise way.

840

## 841 **4.0 ECONOMIC VALUE AND MODELING REPORT**

### 842 **4.1 MODELING OVERVIEW**

843 This section presents an overview of the rationale, approach, and suggested methods for  
844 developing economic models. The intent of the model is to quantify for the healthcare system the  
845 risk-benefit tradeoff of the product, and its economic value.

#### 846 **4.1.1 UTILITY OF MODELING FOR DECISION-MAKING**

847 Available data on the clinical benefits and harms and economic impact of the product  
848 under consideration are provided in Sections 3 and 5 of the *AMCP Format*, and are the  
849 core of evidence-based decision-making. These data, however, may have important  
850 limitations for decision-making. For example,

- 851 • Randomized controlled trials (RCTs) may not include all relevant comparator  
852 interventions

- 853 • The duration of follow-up in RCTs may be limited
- 854 • Patient populations in RCTs may not be reflective of plan populations
- 855 • Safety data may be limited, or from disparate sources
- 856 • Healthcare cost impacts may not be generalizable across payers

857 These limitations have led to recent efforts in comparative effectiveness research to  
858 improve the quantity, diversity, and relevance of information available to healthcare  
859 decision makers. Comparative effectiveness data – derived from studies including  
860 relevant populations, comparators, and outcomes - will prove valuable to healthcare  
861 system formulary decision makers, and should be reported in Section 3 of the *Format*.  
862 These data are more likely (and should be expected) to be available for more mature  
863 products. In addition, evidence may be generated through pay for performance or  
864 coverage with evidence development schemes. Synthesis and evaluation of these data  
865 will remain challenging, however, and are unlikely to be available for new products.

866 Decision-analytic based, cost-effectiveness models are an effective means to assess the  
867 overall potential value of healthcare technologies. They are disease-based and take into  
868 account the impact of the new technology on the clinical outcomes for the target  
869 population. Typically, they include evidence on the incidence of the disease or condition  
870 in the target population, the medical care required to diagnose and treat the disease, the  
871 relative and absolute risk reductions offered by the technology, survival and quality of  
872 life impacts, and the costs of the interventions. Decision models can provide:

- 873 • An explicit framework for decision-making;
- 874 • A synthesis of evidence on health consequences and costs from many different  
875 sources;
- 876 • A formal assessment of uncertainty;
- 877 • A quantitative measure of clinical risk-benefit;
- 878 • Explicit and evaluable assumptions;
- 879 • Specificity for a product’s role or place in therapy; and
- 880 • Benchmarks against which the product's future performance can be measured.

881 Models are not without challenges. In particular, because of the complexity and inherent  
882 required assumptions, models can be perceived as a ‘black-box’ approach or biased. The  
883 AMCP *Format* has been developed to help address these limitations by providing a  
884 consistent format for conducting and reporting cost-effectiveness models to improve their  
885 transparency and acceptability.

#### 886 **4.1.2 TYPES OF MODELS**

##### 887 *Cost-effectiveness models.*

888 These models address the question “Is the technology good value for the  
889 money?” There are several types of models that can be helpful for managed care  
890 decision makers. The focus of the AMCP Format is the clinical and economic  
891 value of products for plans and their members. Evaluations that include impacts  
892 on patients – e.g., morbidity and mortality – and on healthcare costs are thus most  
893 relevant, and termed in general ‘cost-effectiveness models.’ These models are  
894 primarily useful for assessing the overall clinical risk-benefit and economic value  
895 of a product in relation to products in its class and other healthcare interventions  
896 in general, and are the primary focus of this Section. There are several specific  
897 types of cost-effectiveness models, which are discussed in the Methods section  
898 below. Cost effectiveness models utilize clinical data and can be relatively

899 complex, and thus should follow the recommendations in this section, as well as  
900 published best practices.<sup>42,43,44,45,46,47,48</sup>

901 ***Budget impact models.***

902 Budget impact analyses address the question “Is the technology affordable?” A budget  
903 impact model estimates the expected changes in the expenditure of a health care system  
904 after the adoption of a new intervention in a payer-relevant timeframe. Budget impact  
905 models are not intended to establish the overall value of healthcare technologies because  
906 they do not include the full impact of the technology on clinical and patient outcomes.  
907 They can be useful for estimating system-wide (e.g., pharmacy and medical) budget  
908 impacts, however, and are commonly used by managed care payers. These models, as  
909 defined here, estimate the target population, drug/product costs, healthcare cost offsets,  
910 and adverse event costs, as well as the expected utilization in the healthcare system, to  
911 derive projected per member per month costs. Budget impact models utilize clinical data  
912 and can be relatively complex, and thus should follow the recommendations in this  
913 section, and published best practices.<sup>49,50</sup>

914 ***Financial models.***

915 Financial models provide an estimate of the financial impact of a new technology on the  
916 pharmacy budget only because they typically include drug/product costs, network or  
917 other discounts, rebates, co- payment and other benefit design impacts, but no evaluation  
918 of clinical effects or other economic consequences. Payers usually have the necessary  
919 internal resources to develop such models. Although these models may be useful for  
920 negotiations between manufacturers and payers, they are not central to the evidence- and  
921 value-based decision making process, and are not addressed further in the Format.

922 **4.1.3 OTHER CONSIDERATIONS**

- 923 • A clear, written statement of the decision problem, modeling objective, and scope of  
924 the model should be developed. This should include: the spectrum of disease

**DRAFT for Public Comment**  
**AMCP Format for Formulary Submissions, Version 4.0**

- 925 considered, perspective of the analysis, target population, alternative interventions,  
926 health and other outcomes, and time horizon.
- 927 • The International Society for Pharmacoeconomics and Outcome Research (ISPOR)  
928 and Society for Medical Decision Making (SMDM) have produced comprehensive  
929 guidance related to various aspects of modeling.<sup>51,52,53,54,55,56,57</sup> ISPOR-SMDM best  
930 practices should be followed when applicable.
  - 931 • When a product is intended for treatment of more than one disease or indication, its  
932 impact should be modeled for each, unless a reasonable case can be made for a single  
933 model, such as may be the case for budget impact models.
  - 934 • Models that have been previously developed may be adapted for use according to the  
935 AMCP Format. An existing model should be modified to follow the general  
936 framework described in this document and must be able to demonstrate the system-  
937 wide impact of introducing the product to healthcare system formularies. Evidence  
938 supporting the validity of existing models should be provided, as well as sufficient  
939 documentation on their design, functioning, and data inputs.
  - 940 • Cost-effectiveness analyses conducted alongside RCTs, particularly when of  
941 sufficient size and follow-up can provide useful and sometimes substantial evidence  
942 of economic value. Cost-effectiveness models should be considered complementary  
943 to such studies, allowing for the adjustment of healthcare resource use, unit costs,  
944 effectiveness, and practice patterns.
  - 945 • All assumptions should be clearly presented.
  - 946 • Specialty pharmaceuticals should generally be addressed similarly to traditional  
947 pharmaceutical products. Additional considerations may be required for site of care  
948 (e.g. inpatient, home infusion, outpatient infusion center).
  - 949 • Due to similarity to their reference product, biosimilars generally do not require the  
950 development of specific cost-effectiveness models. Budget impact models or cost-  
951 minimization analyses may be more relevant.
  - 952 • When possible a standalone, electronic, unlocked, modifiable model should be  
953 provided to payers. The use of commonly available software (e.g. Microsoft Excel) is  
954 recommended. The model should be interactive and flexible, allowing the user to  
955 choose which inputs to include in the model and the ability to tailor inputs to their  
956 health system or health plan.

- Lastly, users of this document should recognize the Format is a set of recommendations on the types of evidence and reporting formats that are likely to be useful for managed care decision makers. We recognize the need for flexibility, however. Specific requirements are determined by individual managed care organizations, and may consist of data requests or methods beyond those outlined in this document.

963 **4.2 MODELING APPROACHES AND METHODS**

964 Manufacturers should consult with healthcare system staff in the early stages of model  
965 development to identify optimal modeling approaches and ensure the incorporation of appropriate  
966 comparator products and endpoints to reflect clinical reality.

967 **4.2.1 COST –EFFECTIVENESS ANALYSIS APPROACH AND FRAMEWORK**

968 *Guidelines*

969 In general, the cost-effectiveness framework should consider recommendations published  
970 by the International Society for Pharmacoeconomics and Outcomes Research (ISPOR)  
971 and Society of Medical Decision Making (SMDM) Modeling Good Research Practices  
972 Task Force.<sup>58,59,60,61,62,63,64</sup>

973  
974 The model should be disease-based, and depict the following:

- 975
- 976
- 977
- 978
- 979
- 980
- 981
- 982
- 983
- 984
- a) Disease or condition, patient population, natural history, clinical course and outcomes.
  - b) Relevant treatment options and the treatment process for each option – preferably based on treatment guidelines or Actual practice
  - c) Costs of product and other medical resources consumed within each clinical pathway.
  - d) Outcomes of therapy for each clinical pathway
  - e) Incremental cost and outcomes analysis presented in cost/consequences tables and as cost- effectiveness ratios.

984 *Analytic framework*

985 The general category of ‘cost-effectiveness’ models includes analyses that value  
986 outcomes by assessing clinical events, life expectancy, and/or quality-adjusted life-years

<sup>64</sup> Siebert U, Alagoz O, Bayoumi AM, et al. State-transition modeling: a report of the ISPOR-SMDM Modeling Good Research Practices Task Force--3. *Value Health*. 2012;15(6):812-820. Available at: [http://www.ispor.org/workpaper/Modeling\\_Methods/State-Transition\\_Modeling-3.pdf](http://www.ispor.org/workpaper/Modeling_Methods/State-Transition_Modeling-3.pdf).

987 (QALYs). Clinical events are more readily interpretable by clinicians and allow for direct  
988 assessment of the impact of clinical data, but cost per event avoided calculations are not  
989 comparable across disease areas. In contrast, QALYs allow for assessment of overall  
990 healthcare value, but may be more difficult to interpret from a healthcare system  
991 perspective. It is thus recommended that clinical events, life expectancy, and QALYs all  
992 be assessed, with the latter two outcomes primarily relevant for lifetime timeframe  
993 analyses. Clinical events can serve as a supplemental analysis. The results should be  
994 reported separately, as outlined subsequently in this section. Exclusion of any of these  
995 endpoints should be justified. If possible, use of surrogate endpoints should be avoided  
996 since they are not as useful as final endpoints in decision-making.

997 ***Modeling technique***

998 There are several decision-analytic based approaches to constructing disease-based cost-  
999 effectiveness models, primarily: 1) decision trees, 2) Markov (cohort) models, and 3)  
1000 patient-level simulation (discrete event simulation). There are advantages and  
1001 disadvantages to each technique, primarily related to the conflicting factors of  
1002 transparency and data availability vs. the complexity of many diseases and their  
1003 treatments. It is recommended that the simplest feasible modeling approach be utilized.  
1004 In other words, the model should be sophisticated enough to capture the key aspects of  
1005 the disease and treatments, yet be well supported by high-quality data that are available to  
1006 and interpretable by the user.

1007 ***Perspective and Timeframe***

1008 The payer perspective is recommended for the primary analysis, with optional  
1009 perspectives (i.e., societal, employer) conducted as secondary evaluations. The model  
1010 should consider a time horizon that is appropriate to the disease being studied and reflect  
1011 the decision-making and financial and budget constraints consistent with the perspective.  
1012 Multiple timeframes are recommended for chronic disease – e.g., 5-year, 10-year, and  
1013 lifetime. Adjustment for time preference should be incorporated as appropriate and  
1014 follow US PHS Panel recommendations (discounting both future costs and health  
1015 effects).<sup>65</sup>

1016 **4.2.2 DATA SOURCES**

1017 The identification, selection, interpretation, and use of data to inform the model are key  
1018 to the modeling process, and should receive ample attention from model developers and  
1019 users. The analysis should be based on the highest-quality and most up-to-date clinical,  
1020 epidemiologic, patient, and economic data available from the sources most relevant to the  
1021 model. The process for identifying, evaluating, and selecting all of the data in the model  
1022 should be clear and systematic.

1023 It is important that modeled claims for cost-effectiveness derive from data from one or  
1024 more comparative effectiveness trials. These should:

- 1025 • Directly or indirectly compare and quantify treatment effects and other relevant  
1026 patient-reported outcomes (including quality of life)
- 1027 • Assess patient and community preferences for alternative therapies;
- 1028 • Quantify costs and benefits over the natural course of the disease;

---

<sup>65</sup> Gold MR, Siegel JE, Russell LB, Weinstein MC. Cost-effectiveness in health and medicine. New York, NY, Oxford University Press, 1996.

- 1029                   • Assess resources used to support alternative therapies; and  
1030                   • Evaluate the impact of uncertainty on the claims made for alternative therapies  
1031 Parameter estimates used in the model for the product under consideration should be  
1032 closely linked with the evidence provided in all Sections of the *Format*. All necessary  
1033 assumptions should be clearly stated. In addition to the identification of base-case  
1034 estimates for the model, ranges for parameters should be determined and well-referenced.

1035 ***Drug effectiveness***

1036 When available, randomized, controlled trial data should be assessed and considered as  
1037 the basis of all efficacy or effectiveness estimates. Justification should be provided for  
1038 inclusion and exclusion of any RCTs potentially relevant to the analysis. When available,  
1039 real world evidence including prospective and retrospective observational trials, and  
1040 direct and indirect comparisons, should be assessed for relevance and validity. If  
1041 appropriate, this data should also be incorporated into the model.

1042 ***Drug safety data***

1043 Clinically relevant adverse events observed in RCTs should be included in the model, as  
1044 well as safety signals derived from appropriate observational studies. A wide range of  
1045 estimates should be explored given the challenge of accurately ascertaining the likelihood  
1046 of low-probability events.

1047 ***Economic data***

1048 Unit costs data ideally would be relevant to the decision maker, based on healthcare  
1049 system data. If specific healthcare system data are not available, costs from representative  
1050 U.S. private payers, Medicare and others may be used. Because the costs of infused and  
1051 injected drugs may also depend on the site of care, models should take these attributes  
1052 into consideration. Decision-analytic models should be sufficiently flexible to adapt the  
1053 input assumptions to conform to local practice and billing patterns.

1054 ***Utilities***

1055 Preference estimates should be derived from studies surveying either patients or the  
1056 general population, using a direct elicitation method or an instrument such as the EQ-5D,  
1057 HUI, SF-6D, or QWB.

1058 ***Demographic and practice pattern data***

1059 Ideally the model would will be interactive, allowing demographic and practice pattern  
1060 data from the healthcare system to be incorporated improving the relevance of the model.

1061 ***Surrogate markers***

1062 When surrogate markers are used to model longer-term outcomes, specific evidence  
1063 should be provided supporting their validity.

1064 ***Expert opinion***

1065 Data derived from expert panels are not generally acceptable, especially for key  
1066 effectiveness or safety variables. However, this approach may be reasonable for other  
1067 variables where estimates are not available through literature, databases, trials or other  
1068 normal sources. In such cases, the expert assumptions should be clearly stated and  
1069 thoroughly tested in sensitivity analyses. Inputs obtained from an expert panel should be  
1070 modifiable in case local opinion leaders disagree with the panel members.

1071 ***Efficacy vs. effectiveness***

1072 When feasible and scientifically plausible, efficacy results from RCTs should be  
1073 transformed into effectiveness parameters. For example, this may involve inclusion of an  
1074 adherence parameter into the model based on observational data. Documentation and  
1075 clear description of the methodology will be necessary in order for healthcare system  
1076 staff to evaluate the validity of this approach.

#### 1077 **4.2.3 ANALYSIS**

##### 1078 *Base-case estimates*

1079 The expected (average) clinical and economic outcomes should be calculated for each  
1080 strategy evaluated, as well as incremental costs and effectiveness. Differences in the  
1081 absolute risk of events should be determined, and healthcare cost offsets vs. drug costs  
1082 should be displayed independently and combined. Clinical risk-benefit tradeoffs should  
1083 be explicitly presented and discussed.

##### 1084 *Sensitivity analysis*

1085 Both univariate and probabilistic sensitivity analyses should be conducted to provide a  
1086 more complete picture regarding the robustness of the results. Comprehensive one-way  
1087 sensitivity analysis of all parameters in the model is strongly recommended, including  
1088 assessment of impacts on both incremental effectiveness (e.g., QALYs) and cost-  
1089 effectiveness. However, the use of arbitrary lower and upper values is strongly  
1090 discouraged. Use of generally accepted confidence levels (95%) should be employed  
1091 when data are stochastic. The use of tornado diagrams is encouraged to identify the most  
1092 sensitive parameters. The 3-5 parameters and 2-3 assumptions that have the greatest  
1093 impact on the results should be identified. Scenario analyses testing the assumptions used  
1094 in the model are also highly recommended. Generation of cost-effectiveness scatter plots  
1095 and acceptability curves are recommended to display the results of the analysis..

#### 1096 **4.3 BUDGET IMPACT MODEL APPROACH AND FRAMEWORK**

##### 1097 *Guidelines*

1098 The modeling approach and analytic framework of the budget impact model should generally  
1099 follow the guidance provided by the International Society for Pharmacoeconomics and Outcomes  
1100 Research (ISPOR).<sup>66,67</sup>

1101 The model should be health care system based and take the following into consideration:

- 1102 a) Characteristics of health system, such as prevalence and incidence of disease among the  
1103 population and restrictions to access
- 1104 b) Use and cost of current mix of therapies used to treat the condition
- 1105 c) Projected use and costs of the new mix of therapies to treat the condition
- 1106 d) Costs and cost offsets associated with change in use of condition-specific health services

##### 1107 *Perspective and Timeframe*

1108 The perspective of the budget holder is recommended. The time horizon of the model should be  
1109 of relevance to the budget holder, typically one to five years.

---

<sup>66</sup> Sullivan SD, Mauskopf JA, Augustovski F, et al. Budget impact analysis-principles of good practice: report of the ISPOR 2012 Budget Impact Analysis Good Practice II Task Force. *Value Health*. 2014;17(1):5-14. Available at: <http://www.ispor.org/budget-impact-health-study-guideline.pdf>.

<sup>67</sup> Mauskopf JA, Sullivan SD, Annemans, L, et al. Principles of good practice for budget impact analysis: report of the ISPOR Task Force on good research practices--budget impact analysis. *Value Health*. 2007;10(5):336-347. Available at: [http://www.ispor.org/workpaper/research\\_practices/Principles\\_of\\_Good\\_Research\\_Practices-Budget\\_Impact\\_analysis.pdf](http://www.ispor.org/workpaper/research_practices/Principles_of_Good_Research_Practices-Budget_Impact_analysis.pdf).

1110 **Population**

1111 The target population for a budget impact model should include all patients eligible for the new  
1112 intervention during the time frame of interest.

1113 **4.3.1 DATA SOURCES**

1114 The model should be provided to the end user in an unlocked modifiable electronic  
1115 format to allow the end user to input local health system specific data. The model should  
1116 be interactive and flexible, allowing the user to choose which inputs to include in the  
1117 model and the ability to tailor inputs to their health system.

1118 **4.3.2 ANALYSIS**

1119 **Results**

1120 When reporting the economic impact of the intervention, it is recommended to present  
1121 the findings as both the cost per member per month (PMPM) and as the total budget  
1122 impact to the health system.

1123 **Sensitivity analysis**

1124 Sensitivity analyses are recommended for assessing the uncertainty associated with the  
1125 budget impact model. For assessing both structural and parameter uncertainty associated  
1126 with the budget impact model, a variety of scenario analyses are recommended.

1127 Any expected off-label use of the new health technology should not be included in the  
1128 main budget impact analysis, but may be considered in sensitivity analyses.

1129 **4.4 MODELING REPORT AND INTERACTIVE MODEL**

1130 **4.4.1 TRANSPARENCY**

1131 Transparency and clarity of presentation are a necessity. The need for and value of  
1132 transparency is widely recognized and can provide some protection against the negative  
1133 effects of bias and error. Model transparency serves the important purpose of providing  
1134 both a high-level overview of the model structure, components, and outputs as well as  
1135 detailed documentation for users interested in evaluating the technical elements of the  
1136 model.<sup>68</sup> Therefore, researchers are encouraged to focus efforts on the clarity and  
1137 transparency of results. Detailed descriptions that explain the flow of data through the  
1138 model are recommended. All calculations should be explained in a simple straightforward  
1139 manner to allow a non-health economist to comprehend the analysis. This information  
1140 and references should be accessible both in the report format as well as shown directly in  
1141 the model to optimize ease of review.

1142 **Listed below are the recommended requirements for modeling reports and**  
1143 **interactive models.**

1144 **4.4.2 MODELING REPORT FORMAT**

1145 The modeling report should follow the format: 1) Introduction/Background, 2) Methods,  
1146 3) Results, 4) Limitations, 5) Discussion. A 500 word abstract following this same  
1147 format should be provided on the first page of the modeling report, and include an

1148 explicit description of the key drivers of the model results identified in sensitivity and  
1149 scenario analyses.

1150 Below are the minimum recommended figures and tables for economic models. Multiple  
1151 tables in each category (e.g., Table 1a, 1b, etc.) may be used if needed.

1152 Figure 1. Provide a figure displaying the structure of the model (e.g., a decision tree,  
1153 Markov model, budget impact model). A simplified schematic diagram may be used for  
1154 ease of presentation, but a detailed figure should also be included.

1155 Table 1. Provide a table listing all of the model inputs, including probabilities, costs, and  
1156 utility estimates if appropriate. Provide a range of values upon which sensitivity analyses  
1157 are based for each input.

1158 a) Include references in the table for all inputs, including ranges.

1159 b) Note in the table estimates that lack supporting evidence.

1160 Table 2. Provide an explicit list of model assumptions, including assumptions about  
1161 comparator interventions, clinical events, patient management, delivery, administration,  
1162 setting of care, and costs.

1163 Table 3. Present the disaggregated results in a table (e.g., cost-consequence style, with  
1164 costs presented separately from health outcomes). Data presented in this format are more  
1165 easily understood and interpreted by healthcare system formulary committees. The  
1166 following specific data should be presented for each strategy as appropriate for the  
1167 analysis type:

1168 a) The projected clinical events (e.g., heart attacks, cirrhosis, recurrence)

1169 b) The life expectancy and QALY estimates

1170 c) Total healthcare costs

1171 d) The cost of implementing therapy, including all anticipated costs of care  
1172 management, delivery, administration, and setting of care, and the resulting cost  
1173 offsets

1174 e) Model results as appropriate for the model type (e.g., incremental cost-  
1175 effectiveness ratios, PMPM estimates of budget impact)

1176 Figure 2. Present one-way sensitivity analyses on all model inputs in a figure (e.g.,  
1177 tornado diagram) or a table.

1178 a) Clearly present the model inputs or assumptions that drive the difference in 1)  
1179 costs, 2) effects, and 3) incremental cost-effectiveness.

1180 b) When appropriate, present multi-way (e.g., 2-way, best/worst case scenario,  
1181 probabilistic) sensitivity analyses

1182 CHEERS Guidance

1183 In addition to the general guidance provided above, a notable addition to the scientific  
1184 literature related to reporting standards for economic evaluations published since our last  
1185 Format revision is the Consolidated Health Economic Evaluation Reporting Standards  
1186 (CHEERS) Statement.<sup>69</sup> This statement provides additional guidance regarding preferred

---

<sup>69</sup> Husereau D, Drummond M, Petrou S, et al. Consolidated Health Economic Evaluation Reporting Standards (CHEERS)--explanation and elaboration: a report of the ISPOR Health Economic Evaluation Publication Guidelines Good Reporting Practices Task Force. *Value Health*. 2013;16(2):231-250. Available at: <http://www.ispor.org/ValueInHealth/ShowValueInHealth.aspx?issue=3D35FDDBD-D569-431D-8C27-378B8F99EC67>.

1187 reporting standards for economic evaluations. For reference, the CHEERS Checklist is  
1188 provided in Appendix “X”.

1189 **4.4.3 INTERACTIVE MODEL**

1190 *Model characteristics*

1191 To improve transparency and ease of use, it is recommended that models be implemented  
1192 in spreadsheet software. Other software packages should only be used if the user a) is  
1193 familiar with them, and b) agrees with the manufacturer to their use. Custom software  
1194 models are generally discouraged, but may be feasible for use if clearly documented in  
1195 peer-reviewed publications and a users manual. Interactive models should have the  
1196 following characteristics:

- 1197 • All data and calculations relevant to the cost-effectiveness model should be  
1198 contained in the spreadsheet and visible to the user.
- 1199 • All inputs should be modifiable by the user.
- 1200 • To the extent feasible, the model, its logic and its calculations should be clear and  
1201 self-documenting, using best practices for formatting, comments, and  
1202 explanatory guides such as text boxes.
- 1203 • Allow for analysis of relevant sub-populations (age, gender, co-morbidities)  
1204 where applicable.
- 1205 • Allow the healthcare system to incorporate its own data (membership size,  
1206 prevalence rates, cost estimates, etc.) in place of default data, such as national  
1207 norms.
- 1208 • Provide automated 1-way sensitivity analysis.

1209 *Model accessibility*

1210 It is recommended that the healthcare system require that an interactive model be made  
1211 available electronically, (e.g. Microsoft Excel), preferably after meeting with the  
1212 manufacturer to review and discuss its design, key assumptions, base- case results,  
1213 sensitivity analyses, and practical application. If the manufacturer will not provide an  
1214 interactive model for the payer’s use, a clear statement to this effect and standing policy  
1215 should be provided in the modeling report. Alternative approaches include interactive  
1216 modification of the model with a representative of the manufacturer, although such  
1217 arrangements are significantly less desirable. Manufacturers are also encouraged to  
1218 publish economic models in the peer-review literature, and update the models and  
1219 publications with real-world evidence as available

1220 Model users should recognize that input parameters must be plausible, and many  
1221 combinations of inputs in complex models will not be self-consistent. Thus, users should  
1222 modify model inputs based on available data and reasonable assumptions.

1223 **5.0 SECONDARY CLINICAL EVIDENCE AND NON-CLINICAL STUDIES**

1224 Section 5.0 should consist of all other types of evidence and studies that do not fit in Section 3.0 that  
1225 support the use and value of the product reported in a clear and concise format. Examples of evidence in  
1226 this section includes clinical practice guidelines (CPGs), health technology assessments (HTAs) and  
1227 systematic reviews (SRs), compendia, meta-analyses, and non-clinical studies such as administrative  
1228 claims analyses, modeling and pharmaco-economic studies.

1229 Similar to Section 3.0, evidence reported in this section include the following relevancy criteria: FDA-  
1230 approved indications and unapproved uses; published and unpublished studies and data; any study  
1231 regardless of study design; study results regardless of positive, negative, or null findings; and U.S. and  
1232 ex-U.S. studies.

1233 **5.1 CLINICAL PRACTICE GUIDELINES**

1234 Identify important clinical practice guidelines that have been developed and published by medical  
1235 societies, government agencies, and other national or international organizations that are relevant  
1236 to the product. This may also include consensus statements and clinical pathways that are  
1237 evidence-based and provide specific clinical recommendations. Focus on guideline  
1238 recommendations specific to the product, its comparators, and the disease state and how the new  
1239 product is anticipated be included in or influenced by the guidelines. Summarize information  
1240 from clinical practice guidelines briefly and provide a copy of the full guidelines upon request.

1241 **5.2 HEALTH TECHNOLOGY ASSESSMENTS AND SYSTEMATIC REVIEWS**

1242 Summarize relevant health technology assessments (HTAs), systematic reviews, and evidence  
1243 frameworks (also known as value frameworks) that are available. Examples include Cochrane  
1244 Collaboration systematic reviews, formal systematic reviews published in peer-reviewed journals,  
1245 evidence reviews by the Agency for Healthcare Research and Quality (AHRQ), and HTAs from  
1246 recognized public or private organizations, including international bodies such as National  
1247 Institute of Clinical Excellence (NICE) and Canadian Agency for Drugs and Technologies in  
1248 Health (CADTH). Summarize the information that is relevant to the product.

1249 **5.3 COMPENDIA**

1250 Summarize important information found in compendia that are officially recognized by the  
1251 Secretary of Health and Human Services that list the product. If these references are available  
1252 only by subscription, provide PDF documents or reprints of the relevant content.

1253 **5.4 META-ANALYSES**

1254 Summarize meta-analyses, indirect treatment comparisons, and network meta-analyses that have  
1255 been published.

1256 **5.5 NON-CLINICAL STUDIES**

1257 Include studies that do not involve direct patient research, for example research conducted via  
1258 chart reviews, electronic health/medical records, and administrative claims. Also included in this  
1259 section are modeling studies and studies that result in non-clinical metrics such as healthcare  
1260 utilization, economic evidence, and productivity. Conduct and reporting of studies in this section  
1261 should follow accepted practice as evidenced by published methodology and reporting guidelines  
1262 from reputable professional societies or government agencies.

1263 Refer to Section 3.0 for items to be included in study summaries and evidence tables. In addition,  
1264 summaries of economic studies should include the following:

**DRAFT for Public Comment**  
**AMCP Format for Formulary Submissions, Version 4.0**

- 1265                    1. Definition of economic endpoints (mean overall costs, cancer-related cost, \$/LYG,  
1266                    \$/QALY, etc.) including references for standard of care costs  
1267                    2. Data sources for economic endpoints  
1268                    3. Statistical methods/math used to calculate endpoints  
1269                    4. Modeling methodology (if applicable)  
1270                    5. Sensitivity analysis (if applicable)  
1271

1272                    Refer to Section 3.0 for additional guidance that is relevant for this section, e.g., provide reprints  
1273                    upon request, explain criteria for inclusion and exclusion of studies, etc.

1274 **6.0 SUPPORTING INFORMATION**

1275 **6.1 REFERENCES CONTAINED IN DOSSIERS**

1276 Include citations for all known published clinical and economic studies in the bibliography  
1277 section. **Reprints of relevant published studies should be available upon request, and where**  
1278 **possible, provide a link to original sources if they are free.**

1279 **6.2 DOSSIERS AND ECONOMIC MODELS**

1280 **Media:** Manufacturers should submit dossiers in an electronic format rather than in print. This  
1281 will help reduce resource expenditures and improve healthcare system staff's ability to transfer  
1282 evidence directly into P&T committee submission monographs. **In addition manufacturers**  
1283 **must provide a transparent, unlocked copy of the model without a graphical interface.** It  
1284 should be presented electronically as an Excel workbook, ASCII tab-delimited file or an  
1285 alternative electronic format that is agreed upon by the requesting organization or its consultants  
1286 and the manufacturer.

1287 **Transparency:** The model should be transparent, i.e., designed to allow staff or consultants to  
1288 investigate the assumptions and calculations, and to perform independent sensitivity analyses by  
1289 varying individual parameters. **The requesting organization will retain this model for internal**  
1290 **analyses and will not release it to any other party.** Manuscripts that support the development  
1291 and reporting of the model should be either attached as appendices or made readily available  
1292 upon request.

1293 **6.3 PRODUCT PRESCRIBING INFORMATION**

1294 Include FDA-approved label, package insert, or prescribing information.

1295 **6.4 PATIENT INFORMATION**

1296 Include any patient information such as patient package insert (PPI).

1297 **6.5 MATERIAL SAFETY DATA SHEET**

1298 Include Material Safety Data Sheet (MSDS) for product.
